(1) A liquid which consists of a solution of organic compounds (e.g., chlorinated hydrocarbons) and

03/21/12

denser than water. DNAPLs sink through the water column until they reach the bottom of the aquifer where they

form a separate layer. Unlike LNAPLs, DNAPLs flow down the slope of the aquifer bottom...
(2) Non-aqueous phase liquids such as chlorinated hydrocarbon solvents or petroleum fractions with a specific a specific

gravity greater than 1.0 that sink through the water column until they reach a confining layer. Because they are

at the bottom of aquifers '(2) instead of floating on the water table, typical monitoring...

(VOCs) are organic chemicals that have a high vapor pressure at ordinary, room-temperature conditions. Their high

vapor pressure results from a low boiling point, which causes large numbers of molecules to evaporate or sublimate

from the liquid or solid form of the compound and enter the surrounding air. An example is formaldebude with a

boiling point of -19 °C (-2 °F), slowly exiting paint and getting into the air.

Many VOCs are dangerous to human health or cause harm to the environment. VOCs are numerous, varied, and ubiquitous.

They include both man-made and naturally occurring chemical compounds. VOCs play an important role in communication

between plants. [1] Anthropogenic VOCs are regulated by law, especially indoors, where

concentrations are the highest.

VOCs are typically not acutely toxic, but instead have compounding long-term health effects.

Because the concentrations

are usually low and the symptoms slow to develop, research into VOCs and their effects is difficult.
